**CCR5 ANTAGONISTS USEFUL FOR TREATING AIDS****BACKGROUND**

The present invention relates to piperidine derivatives useful as selective CCR5 antagonists, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds. The invention also relates to the use of a combination of a CCR5 antagonist of this invention and one or more antiviral or other agents useful in the treatment of Human Immunodeficiency Virus (HIV). The invention further relates to the use of a CCR-5 antagonist of this invention, alone or in combination with another agent, in the treatment of solid organ transplant rejection, graft v. host disease, arthritis, rheumatoid arthritis, inflammatory bowel disease, atopic dermatitis, psoriasis, asthma, allergies or multiple sclerosis.

The global health crisis caused by HIV, the causative agent of Acquired Immunodeficiency Syndrome (AIDS), is unquestioned, and while recent advances in drug therapies have been successful in slowing the progression of AIDS, there is still a need to find a safer, more efficient, less expensive way to control the virus.

It has been reported that the CCR5 gene plays a role in resistance to HIV infection. HIV infection begins by attachment of the virus to a target cell membrane through interaction with the cellular receptor CD4 and a secondary chemokine co-receptor molecule, and proceeds by replication and dissemination of infected cells through the blood and other tissue. There are various chemokine receptors, but for macrophage-tropic HIV, believed to be the key pathogenic strain that replicates *in vivo* in the early stages of infection, the principal chemokine receptor required for the entry of HIV into the cell is CCR5. Therefore, interfering with the interaction between the viral receptor CCR5 and HIV can block HIV entry into the cell. The present invention relates to small molecules which are CCR5 antagonists.

CCR-5 receptors have been reported to mediate cell transfer in inflammatory diseases such as arthritis, rheumatoid arthritis, atopic dermatitis, psoriasis, asthma and allergies, and inhibitors of such receptors are expected to be useful in the

treatment of such diseases, and in the treatment of other inflammatory diseases or conditions such as inflammatory bowel disease, multiple sclerosis, solid organ transplant rejection and graft v. host disease.

Piperidine derivatives which are muscarinic antagonists useful in the treatment of cognitive disorders such as Alzheimer's disease are disclosed in US patents 5,883,096; 6,037,352; 5,889,006; 5,952,349; and 5,977,138.

Piperidine and piperazine derivatives useful in the treatment of AIDS are disclosed in WO 00/66559 and WO 00/66558.

A-M. Vandamme et al., Antiviral Chemistry & Chemotherapy, 9:187-203 (1998) disclose current clinical treatments of HIV-1 infections in man including at least triple drug combinations or so-called Highly Active Antiretroviral Therapy ("HAART"); HAART involves various combinations of nucleoside reverse transcriptase inhibitors ("NRTI"), non-nucleoside reverse transcriptase inhibitors ("NNRTI") and HIV protease inhibitors ("PI"). In compliant drug-naïve patients, HAART is effective in reducing mortality and progression of HIV-1 to AIDS. However, these multidrug therapies do not eliminate HIV-1 and long-term treatment usually results in multidrug resistance. Development of new drug therapies to provide better HIV-1 treatment remains a priority.

Agents known in the treatment of rheumatoid arthritis, transplant and graft v. host disease, inflammatory bowel disease and multiple sclerosis which can be administered in combination with the CCR5 antagonists of the present invention are as follows:

- 10 solid organ transplant rejection and graft v. host disease: immune suppressants such as cyclosporine and Interleukin-10 (IL-10), tacrolimus, antilymphocyte globulin, OKT-3 antibody, and steroids;  
inflammatory bowel disease: IL-10 (see US 5,368,854), steroids and azulfidine;  
rheumatoid arthritis: methotrexate, azathioprine, cyclophosphamide, steroids and  
15 mycophenolate mofetil;  
multiple sclerosis: interferon-beta, interferon-alpha, and steroids.

Certain CCR5 antagonist compounds of the invention may exist in different isomeric (e.g., enantiomers, diastereoisomers and atropisomers) forms. The  
20 invention contemplates all such isomers both in pure form and in admixture, including racemic mixtures.

Certain compounds will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form pharmaceutically acceptable salts. Examples of such salts may include sodium,  
25 potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, the pyrido-nitrogen atoms may form salts with

The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous NaOH, potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their

- 12 -

respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the acid and base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

The solution was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with aqueous 1N NaOH. The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated. The residue was partitioned between  $\text{Et}_2\text{O}$  and 1 M HCl. The acidic, aqueous layer was extracted with  $\text{Et}_2\text{O}$ . The aqueous layer was cooled to 0 °C. Solid NaOH pellets were added until the pH = 11-12. The basic, aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ . The  $\text{CH}_2\text{Cl}_2$  layers were dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to obtain the benzyl protected piperdino-alcohol (2.92 g, 73 %).

DMSO (1.3 ml, 19 mmol) was taken up in  $\text{CH}_2\text{Cl}_2$  (80 ml), and the resulting solution was cooled to -40 °C ( $\text{CO}_2/\text{CH}_3\text{CN}$ ). Oxalyl chloride (1.6 ml, 19 mmol) was added slowly to the solution at -40 °C. The solution was allowed to stir at 40 °C for 0.5 h. The N-(4-methoxybenzyl)-piperdino-alcohol (2.92 g, 12 mmol) was added as a solution in  $\text{CH}_2\text{Cl}_2$  (15 ml) to the reaction mixture at -40 °C. The resulting solution was stirred at -40 °C for 0.5 h.  $\text{Et}_3\text{N}$  (5.2 ml, 37 mmol) was added to the solution at -40 °C. The resulting white slurry was stirred for 20 min. at that temperature. The mixture was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with aqueous 1 N NaOH. The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ . The combined  $\text{CH}_2\text{Cl}_2$  layers were dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to obtain the aldehyde **2** as a yellow oil (2.8 g, 97 %).

The solution was stirred at that temperature for 2 h. The reaction mixture was partitioned between EtOAc and sat. NH<sub>2</sub>Cl. The aqueous layer was extracted with EtOAc. The combined EtOAc layers were washed with brine and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration furnished a yellow oil. The material was purified by preparative thin-layer chromatography (2/1 hexanes/acetone, SiO<sub>2</sub>) to obtain 207 mg (73 %) of compound **5a** as a yellow oil.

Filtration and concentration gave the crude product. Purification by preparative thin-layer chromatography (95/5 EtOAc/Et<sub>3</sub>N, SiO<sub>2</sub>) gave 144 mg (72 %) of amide **6a** as a colorless oil. HRMS (MH<sup>+</sup>) found: 625.4222.

The solution was stirred at 25 °C for 0.5 h, then concentrated. The residue was taken up in MeOH, and 1 N NaOH was added to the solution. The solution was stirred at 25 °C for 2.5 h, then concentrated. The residue was partitioned between CH<sub>2</sub>Cl<sub>2</sub> and 1 N NaOH. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to obtain a mixture of example **6b** and

- 22 -

4-methoxy benzyl alcohol. Example **6b** was purified by crystallization of the corresponding HCl salt. HRMS ( $MH^+$ ) found: 505.3661.

The free base of example **6b** (42 mg, 0.08 mmol) and  $MeSO_2Cl$  (0.020 ml) were partitioned between  $CH_2Cl_2$  and 1N NaOH. The solution was stirred at 25 °C for 4 h. The layers were separated, and the aqueous layer was extracted with  $CH_2Cl_2$ . The combined organic layers were dried ( $Na_2SO_4$ ), filtered, and concentrated. The residue was purified by thin layer chromatography (95/5 EtOAc/ $Et_3N$ ,  $SiO_2$ ) to give the title compound as a colorless oil. The bis-HCl salt was formed by dissolving the free-base in EtOAc followed by trituration with 2 M HCl in  $Et_2O$ .

Details of the preparation of 1BF:

Step A:

- 5 The product of Example 1, Step 2 (1.0 g, 1.6 mmol) was taken up in THF (10 ml) under an atmosphere of N<sub>2</sub> and a solution of 3-fluorophenylmagnesium bromide (13 ml, 0.5 M in Et<sub>2</sub>O) was added at 25 °C. The solution was stirred at 25 °C for 6 h. The reaction mixture was poured into a separatory funnel containing 25 % aqueous

Filtration and concentration furnished a yellow oil. The material was purified by flash chromatography (3/1 hexanes/acetone,  $\text{SiO}_2$ ) which gave 640 mg (66 %) of compound **5b** as a yellow oil.

5 Step B:

**5b** (640 mg, 1.05 mmol) was deprotected according to the procedure of Example 1, Step 4 to obtain the deprotected piperidine. The piperidine (533 mg, 0.32 mmol), EDC (400 mg, 0.48 mmol), HOBT (280 mg, 0.48 mmol), 4,6-dimethyl-3-pyrimidine-5-carboxylic acid (240 mg, 0.48 mmol) and  $i\text{Pr}_2\text{NEt}$  (0.72 ml, 2.24 mmol) were taken up in DMF (5 ml) and subjected to conditions described above in Step 4 to furnish 414 mg (62 %) of **6b** as a yellow oil.

The solution was concentrated on the rotovap. The residue was purified via preparative thin-layer chromatography (10/1 EtOAc/EtOH,  $\text{SiO}_2$ ) to obtain 14 mg (17 %) of 1BF as a colorless oil. The bis-HCl salt was formed as described above for **6a**. M.p. = 206-210 °C.

20 Example 2

- 26 -

The aldehyde **2** (0.93 g, 4.0 mmol), piperidino-piperazine **3** (1.0 g, 3.4 mmol), and Na(AcO)<sub>3</sub>BH (860 mg, 4.0 mmol) were taken up in CH<sub>2</sub>Cl<sub>2</sub>. Steps 7-8:

Step 7: **46** (500 mg, 1.3 mmol), p-anisaldehyde (1.2 ml, 1.6 mmol), and  $\text{Na}(\text{AcO})_3\text{BH}$  (340 mg, 1.6 mmol) were taken up in  $\text{CH}_2\text{Cl}_2$  and stirred at 25 °C (18 h). The solution was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with 1 N  $\text{NaOH}_{(\text{aq.})}$ . The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ , the combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated to give the crude p-methoxybenzyl (PMB) protected piperazine **47** as a mixture of isomers. Purification via flash chromatography (6/1 hexanes/EtOAc,  $\text{SiO}_2$ ) gave 713 mg of **47** as a semisolid (mixture of isomers). Purification via recrystallization (hexanes/ $\text{CH}_2\text{Cl}_2$ ) gave 220 mg (34 %) of the (S,S) isomer **47** as white needles.

Step 8: **47** (220 mg, 0.45 mmol) and 4.0 M HCl in dioxane (2 ml) were taken up in  $\text{CH}_3\text{OH}$  and stirred at 25 °C (4 h). The solution was concentrated, and the residue was partitioned between  $\text{CH}_2\text{Cl}_2$  and 1 N  $\text{NaOH}_{(\text{aq.})}$ . The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration gave 182 mg (100 %) of **48** as a colorless oil.

Steps 9-10:

Step 9: **48** was derivatized into **49** using the procedure of Example 3, Step 1.

Step 10: The Boc group in **49** was removed (HCl), and the resulting piperidine was coupled to the pyrimidine acid as described in Scheme A to furnish the title compound as a yellow oil: HRMS( $\text{MH}^+$ ) found: 625.4235.

Using similar procedures and the appropriate reagents, compounds of the structure

were prepared, where R<sup>1</sup> is defined in the following table:

Ex.	R <sup>1</sup>	HRMS(MH <sup>+</sup> ) found
4A	CH <sub>3</sub> SO <sub>2</sub>	583.3419
4B	3-Cl -C <sub>6</sub> H <sub>4</sub> SO <sub>2</sub>	679.3204

### Example 5

#### Step 1:

Compound **3** (2 g, 6.7 mmol), allyl chloroformate (0.93 ml, 8.7 mmol), and K<sub>2</sub>CO<sub>3</sub> (5.6 g, 40 mmol) were partitioned between EtOAc and H<sub>2</sub>O. The mixture was stirred vigorously at 25 °C (24 h). The layers were separated, and the aqueous layer was extracted with EtOAc. The combined EtOAc layers were washed with brine and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration gave 2.6 g (100%) of the alloc protected piperazine as a thick yellow oil.

The Boc group was removed, and the resulting piperidine was coupled to the pyrimidine acid as described in Scheme A, Step 4, to obtain 2.3 g (85 % from **3**) of the piperidine-amide **50** as a yellow foam.

#### Steps 2-3:

The Alloc group in **50** was removed according to the conditions described for the conversion of **45** to **46** above in Example 4 which furnished piperazine **51**.

**51** (450 mg, 1.36 mmol), imidoyl chloride **52** (360 mg, 1.36 mmol), and iPr<sub>2</sub>NEt (1.2 ml, 6.8 mmol) were taken up in CH<sub>2</sub>Cl<sub>2</sub> and stirred at 25 °C (18 h). The solution

- 32 -

was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with water. The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration gave the crude amide-oxime **53**. Purification via preparative thin-layer chromatography (95/5 EtOAc/ $\text{Et}_3\text{N}$ ,  $\text{SiO}_2$ ) gave 550 mg (72%) of amide-oxime **53** as a mixture of isomers.

**Step 4:**

**53** (550 mg, 0.99 mmol),  $\text{EtI}$  (0.16 ml, 1.98 mmol), and  $\text{Bu}_4\text{NHSO}_4$  (3 mg, 0.01 mmol) were partitioned between toluene and aqueous 50 %  $\text{NaOH}$ . The mixture was stirred vigorously at  $25^\circ\text{C}$  (18 h). The mixture was diluted with EtOAc and water. The aqueous layer was extracted with EtOAc. The combined organic layers were washed with brine and dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration gave a yellow oil. Purification via preparative thin-layer chromatography (95/5 EtOAc/ $\text{Et}_3\text{N}$ ,  $\text{SiO}_2$ ) gave 457 mg (79 %) of **54** as a yellow oil (mixture of isomers).

**Step 5:**

The Boc group in **54** was removed by  $\text{HCl}$  as described in Scheme A, Step 4. The resulting piperidine was reacted with 3-chlorobenzene sulfonyl chloride, according to the procedure described in Example 1, Step 5, second paragraph, to obtain Example 5 as a yellow oil.  $\text{HRMS}(\text{MH}^+)$  : 660.3089.

Using similar procedures and the appropriate reagents, compounds of the structure

were prepared, where  $\text{R}^1$  is defined in the following table:

Ex.	$\text{R}^1$	$\text{HRMS}(\text{MH}^+)$ found
5A	4- $\text{CH}_3\text{OC}_6\text{H}_4\text{SO}_2$	656.3588
5B	$\text{CH}_3\text{SO}_2$	564.3328

The following assays can be used to determine the CCR5 inhibitory and antagonistic activity of the compounds of the invention.

CCR5 Membrane Binding Assay:

A high throughput screen utilizing a CCR5 membrane binding assay identifies inhibitors of RANTES binding. This assay utilizes membranes prepared from NIH 3T3 cells expressing the human CCR5 chemokine receptor which have the ability to bind to RANTES, a natural ligand for the receptor. Using a 96-well plate format, membrane preparations are incubated with  $^{125}\text{I}$ -RANTES in the presence or absence of compound for one hour. Compounds are serially diluted over a wide range of 0.001ug/ml to 1 ug/ml and tested in triplicates. Reaction cocktails are harvested through glass fiber filters, and washed thoroughly. Total counts for replicates are averaged and data reported as the concentration required to inhibit 50 percent of total  $^{125}\text{I}$ -RANTES binding. Compounds with potent activity in the membrane binding assay are further characterized in second cell-based HIV-1 entry and replication assays.

HIV-1 Entry Assay:

Replication defective HIV-1 reporter virions are generated by cotransfection of a plasmid encoding the NL4-3 strain of HIV-1 (which has been modified by mutation of the envelope gene and introduction of a luciferase reporter plasmid) along with a plasmid encoding one of several HIV-1 envelope genes as described by Connor et al, Virology, 206 (1995), p. 935-944. Following transfection of the two plasmids by calcium phosphate precipitation, the viral supernatants are harvested on day 3 and a functional viral titer determined. These stocks are then used to infect U87 cells stably expressing CD4 and the chemokine receptor CCR5 which have been preincubated with or without test compound. Infections are carried out for 2 hours at 37 °C, the cells washed and media replaced with fresh media containing compound. The cells are incubated for 3 days, lysed and luciferase activity determined. Results are reported as the concentration of compound required to inhibit 50% of the luciferase activity in the control cultures.

HIV-1 Replication Assay:

This assay uses primary peripheral blood mononuclear cells or the stable U87-CCR5 cell line to determine the effect of anti-CCR5 compounds to block infection of primary HIV-1 strains. The primary lymphocytes are purified from normal healthy donor and stimulated *in vitro* with PHA and IL-2 three days prior to infection. Using a 96-well plate format, cells are pretreated with drug for 1 hour at 37 °C and subsequently infected with an M-tropic HIV-1 isolates. Following infection, the cells are washed to remove residual inoculum and cultured in the presence of compound for 4 days. Culture supernatants are harvested and viral replication measured by determination of viral p24 antigen concentration.

Calcium Flux Assay:

Cells expressing the HIV coreceptor CCR5 are loaded with calcium sensitive dyes prior to addition of compound or the natural CCR5 ligand. Compounds with agonist properties will induce a calcium flux signal in the cell, while CCR5 antagonists are identified as compounds which do not induce signaling by themselves but are capable of blocking signaling by the natural ligand RANTES.

GTP $\gamma$ S Binding Assay (secondary membrane binding assay):

A GTP $\gamma$ S binding assay measures receptor activation by CCR5 ligands. This assay measures the binding of  $^{35}$ S labeled-GTP to receptor coupled G-proteins that occurs as a result of receptor activation by an appropriate ligand. In this assay, the CCR5 ligand, RANTES, is incubated with membranes from CCR5 expressing cells and binding to the receptor activation (or binding) is determined by assaying for bound  $^{35}$ S label. The assay quantitatively determines if compounds exhibit agonist characteristics by inducing activation of the receptor or alternatively antagonist properties by measuring inhibition of RANTES binding in a competitive or non-competitive fashion.

Chemotaxis Assay:

The chemotaxis assay is a functional assay which characterizes the agonist vs. antagonist properties of the test compounds. The assay measures the ability of a non-adherent murine cell line expressing human CCR5 (BaF-550) to migrate across a membrane in response to either test compounds or natural ligands (i.e., RANTES, MIP-1 $\beta$ ). Cells migrate across the permeable membrane towards compounds with agonist activity. Compounds that are antagonists not only fail to induce chemotaxis, but are also capable of inhibiting cell migration in response to known CCR5 ligands.

The role of CC chemokine receptors such as CCR-5 receptors in inflammatory conditions has been reported in such publications as Immunology Letters, 57, (1997), 117-120 (arthritis); Clinical & Experimental Rheumatology, 17 (4) (1999), p. 419-425 (rheumatoid arthritis); Clinical & Experimental Immunology, 117 (2) (1999), p.237-243 (atopic dermatitis); International Journal of Immunopharmacology, 20 (11) (1998), p. 661-7 (psoriasis); Journal of Allergy & Clinical Immunology, 100 (6, Pt 2) (1997), p. S52-5 (asthma); and Journal of Immunology, 159 (6) (1997), p. 2962-72 (allergies).

In the assay to determine HIV replication, compounds of the invention range in activity from an IC<sub>50</sub> of about 0.1 to about 1000 nM, with preferred compounds having a range of activity from about 0.1 to about 100 nM, more preferably about 0.1 to about 10 nM.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules,

Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 10 mg to about 500 mg, preferably from about 25 mg to about 300 mg, more preferably from about 50 mg to about 250 mg, and most preferably from about 55 mg to about 200 mg, according to the particular application.

The actual dosage of the compound of formula I employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

- 36 -

The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical  
5 recommended daily dosage regimen for oral administration can range from about 100 mg/day to about 300 mg/day, preferably 150 mg/day to 250 mg/day, more preferably about 200 mg/day, in two to four divided doses.

The doses and dosage regimens of the NRTIs, NNRTIs, PIs and other agents used in combination with the CCR5 antagonist compound will be determined by the  
10 attending clinician in view of the approved doses and dosage regimens in the package inserts or as set forth in the protocols, taking into consideration the age, sex and condition of the patient and the severity of the condition treated.

The goal of the HIV-1 therapy of the present invention is to reduce the HIV-1-RNA viral load below the detectable limit. The "detectable limit of HIV-1-RNA" in the  
15 context of the present invention means that there are fewer than about 200 to fewer than about 50 copies of HIV-1-RNA per ml of plasma of the patient as measured by quantitative, multi-cycle reverse transcriptase PCR methodology. HIV-1-RNA is preferably measured in the present invention by the methodology of Amplicor -1 Monitor 1.5 (available from Roche Diagnostics) or of Nuclisens HIV-1 QT -1.

20 While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
